

ix NEW FEATURES

UNITED PLANET INTREXX XTREME
RELEASE 3

General

All changes that will affect businesses and users upon release of Internet Explorer 7 have been taken into account for this release.

New in the Application Designer

Application Template: WIKI

With the *Wiki* application template, a comprehensive collection of pages can be made available. In it, the structure of the application's contents will result from interlinking between individual pages. No hierarchy will be used to arrange the articles. For formatting and linking, a simple-to-learn syntax will be used. An overview of possible formatting options can be seen in the help pages of the application. This template supports versioning and the ability to return to an earlier edit status of an article.

View Element: WIKI

In addition to the template, the WIKI functionality can also be placed into all applications. To do this, a view element of type *Textfield* (data type *Longtext*) will be set as WIKI.

Filter: Organizational Affiliation

This new filter checks whether a specific user is contained within an organizational unit. With it, data records at the user level can be shown or hidden, corresponding to department.

Edit and View Element *Textfield*, Option *Distribution List Selection*

This option can be assigned to a text field. With it, the complete optical display of the text field will be changed. In the web, organizational units, user groups, or users can be selected and saved from a distribution list.

E-Mail Distribution

Organizational units can now also be selected as distribution lists for eMails. In doing so, all users that have been assigned to the organizational unit will receive an eMail.

New Chart Settings in the *Resources* Template

The resources chart now offers additional possibilities to horizontally and vertically orient the main scale and the display of resources. The chart settings can be reached in the browser via the *Options* link on the start page of a resources application.

New in Tools

SystemCare

SystemCare is a collection of tools for system maintenance. Currently, the following modules are available:

- Deletion of old portal exports
- Check application tables for correct assignments
- Archive (compress as .zip) old log files
- Check databases for characters that cannot be exported

In the *Diagnosis* area, a list of log files or configuration directories can be quickly compressed into a .zip file and prepared to be sent to support. All passwords will be automatically removed from these files.

New Data Sources

With the new data sources *SAP Business Suite* and *SAP Business One*, SAP systems can be configured for the Business Integration Adapter.
